

LDS+N for Excel

A quick tour of the add-in

LDS+N is an Excel add-in for people who spend their day inside wide tables of data that arrive from somewhere else — an export, a report, a download. It does not try to make a worksheet perfect. It tries to get you from "raw dump" to "mostly presentable and easy to work with" in a few clicks, so that the remaining touch-ups are minutes of manual work rather than an hour.

Everything it does uses ordinary Excel features — tables, number formats, conditional formatting, a worksheet function. Once a workbook has been tidied with LDS+N, it stays tidied when it is opened on a machine that does not have the add-in.

This document walks through the features in the order you would typically use them on a fresh export: **Make Table** → **Format Columns** → **Group Columns** → **Row Viewer** → **Formula Report**, then finishes with the **Power Query** tools for moving queries between workbooks. First, though, a look at the ribbon and one small feature you will use with all of the others.

The LDS+N ribbon tab

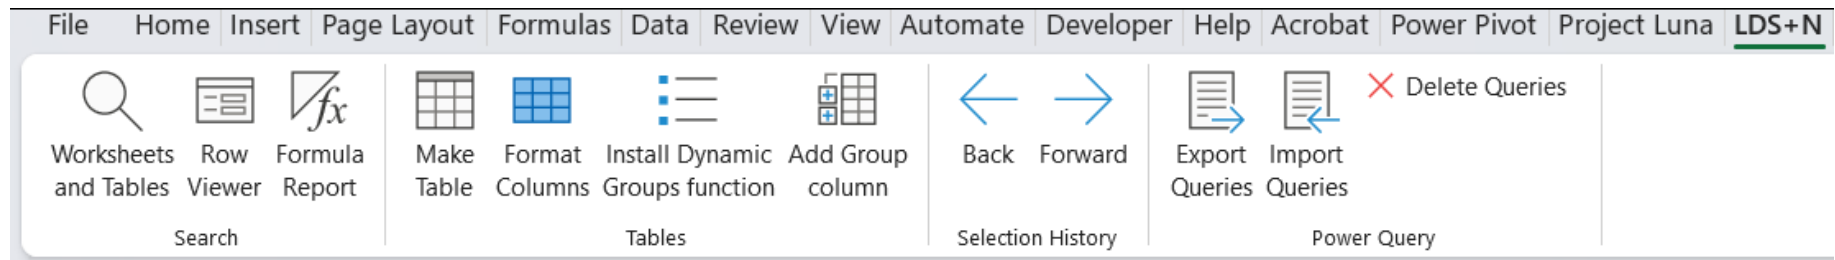

Figure 1 — The LDS+N ribbon tab. Left to right: Search, Tables, Selection History, and Power Query groups.

The tab has four groups:

- **Search** — Worksheets and Tables (find and jump to a sheet or table by name), Row Viewer, and Formula Report.
- **Tables** — Make Table, Format Columns, and the two Dynamic Groups buttons.
- **Selection History** — Back and Forward, described next.
- **Power Query** — Export Queries, Import Queries, and Delete Queries, described in section 6.

Getting around: Back and Forward

Excel has no "go back to where I was" command. LDS+N adds one. Every time you select a cell somewhere else — on the same sheet, on another sheet, or in another workbook — the previous location is remembered. **Alt+Left** (or the ribbon **Back** button) takes you back to where you came from; **Alt+Right** (or **Forward**) retraces your steps.

This behaves like the back and forward buttons in a web browser. It is most useful when you are bouncing between a summary and the detail behind it, or between a table and a lookup sheet, and it is what makes the Formula Report at the end of this document practical to use — you can jump from a report row to the cell it describes and come straight back.

1. Make Table

Data usually arrives as a plain range: gridlines on, nothing frozen, no filters, everything in the default style. This is what the sample data looks like when it is opened for the first time. Note that the two date columns are not even consistent — one has been formatted as a date and the other still shows Excel's internal serial numbers.

Figure 2 — A typical starting point: a plain range with gridlines, unformatted dates, and no frozen header row.

With any cell in the data selected, click **Make Table**. In one step it:

- converts the range to an Excel table, which gives you filter buttons and structured column names;
- applies a plain, uncluttered table style;
- freezes the header row so it stays visible as you scroll;
- turns off gridlines.

Figure 3 — After Make Table: the range is now a table with filters and a frozen header row.

You can, of course, do each of these things yourself. The point is that you no longer have to remember to.

2. Format Columns

This is the workhorse. Select a cell in the table and click **Format Columns** (or press **Ctrl+Shift+M**). LDS+N looks at the contents of every column and guesses its data type — text, integer, decimal, date, date/time, time, or percentage — and presents its guesses for review:

Column	Yes	Text	8.22
Region	Yes	Text	8.22
State	Yes	Text	47.14
City	Yes	Text	14.27
Account	Yes	Text	22.22
Order ID	Yes	Integer	7.22
Order Date	Yes	Date	8.78
Ship Date	Yes	Date	6.33
Days to Ship	Yes	Integer	6.44
Sales Rep	Yes	Text	10.56
Channel	Yes	Text	9.33
Category	Yes	Text	10.33

On the right, the following options are available:

- ☐ Date/Time
- ☐ Date
- ☐ Time
- ☐ Decimal
- ☐ Integer
- ☒ Text
- ☐ Percentage

Additional settings: ☒ Cached, Column Width: 8.22

Buttons: Save, Close

Figure 4 — The Data Type dialog. Each column is listed with its guessed type; select a row to override the type or the width.

You can accept the guesses as they are, or click a column and choose a different type on the right. Your choices are **cached by column name**, so the next time a report with the same column headings arrives, the dialog already knows what you decided last time. Over time the review step becomes a glance-and-close.

When you click **Close**, LDS+N applies to every column:

- a number format matching the data type — thousands separators for integers, two decimals for amounts, **yyyy-mm-dd** for dates (which sort correctly as text and are unambiguous across regions), a percent sign for percentages;
- wrapped, right-aligned headings for numeric columns, so a wide heading no longer forces a narrow column to be wide;
- a column width sized to the wider of the wrapped heading and the first row of data.

Figure 5 — After Format Columns: consistent ISO dates, number formats, wrapped headings, and tightened column widths.

The width rule is deliberately simple — it measures the *first* data row, not the whole column, so it is fast on large tables. Occasionally a later row is wider than the first and shows as ##### (visible in the Unit Price column above). Those are fixed with a double-click on the column border. This is the "mostly perfect" philosophy: a few seconds of manual tuning on a table that would otherwise have taken twenty minutes to format by hand.

Reports are frequently sorted by a hierarchy — Region, then State, then City, then Account — and the columns on the left repeat the same value for row after row. That repetition makes it hard to see where one group ends and the next begins.

Figure 6 — The Dynamic Groups prompt. Columns 1–4 are Region, State, City, and Account.

LDS+N adds conditional formatting to the table that does two things:

- **Dims repeated values.** Within each group, only the first occurrence of a value is shown in normal text; the repeats are shown in light grey. The values are still there, still filterable, still sortable — they are just quieter.
- **Draws a border between groups** at each level, so the boundaries of a state, a city, or an account are visible at a glance.

Figure 7 — After Group Columns: repeats dimmed and borders drawn at each level of the hierarchy.

The formatting is **dynamic**: it is driven by a small worksheet function (installed by the **Install Dynamic Groups function** button) and by conditional formatting rules, so if the table is re-sorted or rows are added, the dimming and borders adjust themselves. Because it is ordinary conditional formatting, it also keeps working in a workbook opened without the add-in, and it can be edited like any other rule — for example, to extend the dimming to a column that depends on one of the group columns.

4. Row Viewer

When a table has twenty-five columns, most of them are off the screen at any given moment. To see the whole record for one row you end up scrolling sideways, losing your place, and scrolling back. The Row Viewer solves this by showing all the fields of the current row in a separate window that follows your selection.

Click **Row Viewer** on the ribbon to open it. It floats beside Excel and stays open while you work; as you move from row to row in the table, the viewer updates. Selecting a field in the viewer selects that cell on the sheet, and the sheet scrolls to bring it into view — so the two windows are always in step.

The Row Viewer window displays the following data for row 1:

Sort	Ordinal	Field	Value	Descen
1	Region	Midwest		
2	State	Kentucky		
3	City	Louisville		
4	Account	Ridge Distributors		
5	Order ID	41,000		
6	Order Date	2026-07-29		
7	Ship Date	2026-08-04		
8	Days to Ship	6		
9	Sales Rep	M. Okafor		
10	Channel	Online		
11	Category	Hand Tools		
12	Product	Torpedo Level 9 in		
13	SKU	HT-0900		
14	Qty	50.00		
15	Unit Price	14.25		
16	Extended	712.50		
17	Discount %	0%		
18	Discount Amt	0.00		
19	Net	712.50		
20	Sales Tax	42.75		
21	Total	755.25		
22	Shipping	6.12		
23	Landed Total	761.37		

The Excel window shows the following table data:

Figure 8 — The Row Viewer showing all 25 fields of row 1. Selecting "Discount Amt" in the viewer selected cell R2 on the sheet.

Three things worth knowing:

- **Sort.** The field list can be shown in table order (Ordinal), alphabetically by field name, or by value — useful for spotting which fields are empty or which hold the largest numbers.
- **Search.** Start typing and the list narrows to the fields whose name or value contains what you typed. In Figure 9, typing "disc" leaves just the two discount fields.
- **Keyboard.** The viewer is designed to be driven from the keyboard, so you can page through rows and fields without reaching for the mouse.

The image shows a 'Row Viewer' window on the left and an Excel ribbon on the right. The Row Viewer window is titled 'Row Viewer - tblMyTable1, row 1 of 179'. It has a 'Sort' section with four options: 'Ordinal' (selected), 'Field', 'Value', and 'Descen'. Below this, a search bar contains the text 'disc'. The results show two rows: row 17 with 'Discount %' and '0%', and row 18 with 'Discount Amt' and '0.00'. The Excel ribbon on the right shows the 'Formulas' tab selected. The formula bar displays '=ROUND(P2*Q2,2)'. The worksheet grid shows columns R through Y. Row 1 has headers: 'Discount Amt', 'Net', 'Tax', 'Total', 'Shipping', 'Total', 'Status', and 'Notes'. Row 2 has values: '0.00', '717.50', '42.75', '755.25', '6.12', '761.37', 'Shipped', and an empty 'Notes' cell.

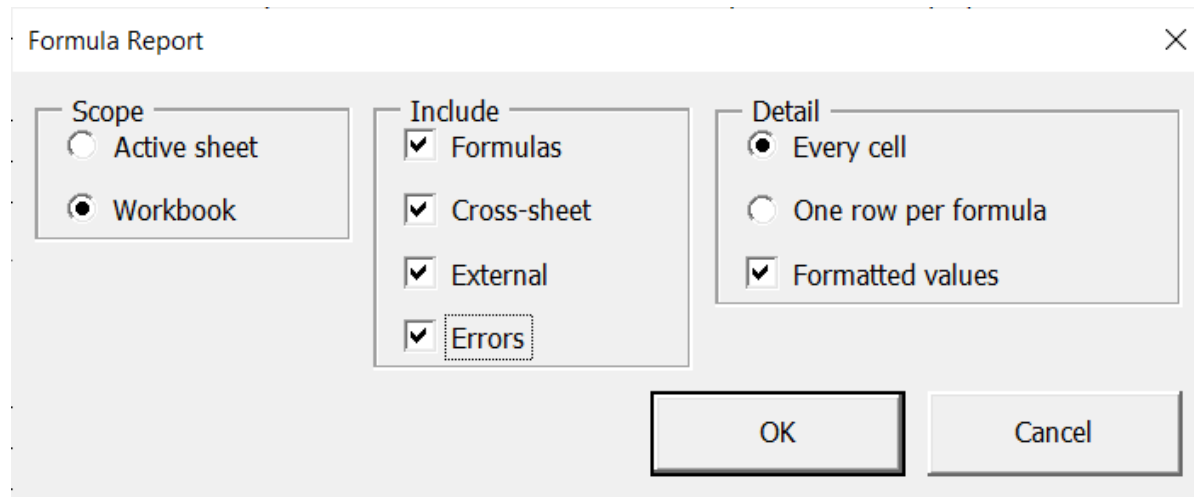

Discount	Sales	Landed					
Amt	Net	Tax	Total	Shipping	Total	Status	Notes
0.00	717.50	42.75	755.25	6.12	761.37	Shipped	

Figure 9 — Row Viewer search: "disc" filters the 25 fields down to the two that match.

5. Formula Report

This feature is for understanding a workbook rather than tidying it — particularly a workbook someone else built. It answers the question "what formulas are in here, and where?"

Click **Formula Report** and choose what to include:

The 'Formula Report' dialog box is shown with the following settings:

- Scope:** ☐ Active sheet, ☒ Workbook
- Include:** ☒ Formulas, ☒ Cross-sheet, ☒ External, ☒ Errors
- Detail:** ☒ Every cell, ☐ One row per formula, ☒ Formatted values

Buttons: OK, Cancel

Figure 10 — The Formula Report options. Scope, what to include, and whether to list every cell or one row per distinct formula.

- **Scope** — just the active sheet, or every sheet in the workbook.
- **Include** — ordinary formulas, formulas that reference other sheets, formulas that reference other workbooks, and cells currently showing an error.
- **Detail** — one row for every formula cell, or one row per distinct formula pattern (much shorter for a large table where the same formula is filled down a column).

The result is a new sheet with a table listing each formula. Two columns deserve a mention: **Formula (R1C1)** shows the formula in relative notation, which is identical for every cell in a filled-down column, and **Count** shows how many cells share that pattern. Repeats of the same pattern are dimmed using the same Dynamic Groups treatment described above, so each distinct formula stands out with its count beside it. **Formula (A1)** shows the familiar cell-address version, and **Value** shows what the cell currently evaluates to.

	A	B	C	D	E	F
1	Select a report row, then press Alt+Right (or ribbon Forward) to go to that cell. Alt+Left returns here.					
2						
3	Sheet	Formula (R1C1)	Count	Cell	Formula (A1)	Value

Figure 11 — The Formula Report sheet. The instruction in row 1 explains the navigation; the highlighted row (S5) is about to be jumped to.

The line at the top of the report (see previous page) is the important part: **select a report row and press Alt+Right** (or ribbon Forward) to jump to that cell in the source sheet. **Alt+Left** brings you back to the report. This is the Back/Forward feature from the start of this document, and it turns the report from a static listing into a way of walking through a workbook formula by formula.

6. Power Query: Export, Import, and Delete Queries

Power Query (Excel's "Get & Transform" tools) is how many reports pull in and reshape their data, and a workbook can accumulate dozens of queries. They live inside the workbook, visible only in the Queries & Connections pane, which makes three ordinary jobs awkward: copying a set of queries into another workbook, keeping a readable copy of them outside Excel, and clearing out the ones that are no longer used. The **Power Query** group on the ribbon handles all three.

Export Queries writes every query in the active workbook to a single text file. A standard Save As dialog opens, with the file named after the workbook and a **.pq** extension. The file is in the format Excel itself uses to store queries, so it is readable in any text editor: each query appears under its name, and the query group it belonged to is noted in a comment above it.

```
section Section1;

// group: Lookups
shared Products =
let
    Source = Excel.CurrentWorkbook(){[Name="tblProducts"]}[Content]
in
    Source
;

shared #"Orders by Region" =
let
    Source = Orders,
    Grouped = Table.Group(Source, {"Region"}, {"Net", each List.Sum([Net]), type number})
in
    Grouped
;
```

Import Queries is the reverse. A standard Open dialog lets you pick one or more .pq files; every query in them is added to the active workbook. A query with the same name as one already in the workbook is *updated in place* rather than duplicated, so re-importing a revised file is safe. Newly added queries arrive as connection-only; load any that need a worksheet table in the usual way. A message at the end reports how many were added and how many updated.

Delete Queries opens a list of every query in the workbook with a checkbox beside each. Tick the ones to remove (or use Select All and Select None), then click Delete. The Delete button is the confirmation; Cancel, Esc, or closing the form leaves the workbook untouched.

The dialog box is titled "Delete Queries from Claude Export.xlsm - 0 of 10 selected". It contains a list of queries with checkboxes:

- ☐ Claude Code Projects
- ☐ Conversation Activity Log
- ☐ Conversation Messages
- ☐ Conversations
- ☐ Conversations Found
- ☐ Exports
- ☐ fnConversationSearch
- ☐ recConfig
- ☐ txtExportFolder
- ☐ txtSearch

On the right side, there are four buttons: "Select All", "Select None", "Delete", and "Cancel".

Figure 13 — The Delete Queries form. The title shows the workbook and how many queries are selected.

Together these make queries portable in a way Excel does not offer on its own: build a set of queries once, export them, and import the file into every workbook that needs them. The .pq file is plain text, so it can be stored alongside the workbook, compared between versions, and shared with someone who wants to see how the data was prepared without opening the workbook at all.

Putting it together

On a new export, the whole sequence takes well under a minute:

- Open the file and click somewhere in the data.
- **Make Table** — filters, frozen header, gridlines off.
- **Format Columns** — glance at the data types, Close, fix any overflowed (#####) columns.
- **Add Group column** if the data is sorted by a hierarchy.
- Open the **Row Viewer** if you need to read whole rows; run a **Formula Report** if you need to understand what the sheet is calculating.
- **Export Queries** to keep a text copy of a workbook's queries or move them to another workbook; **Import Queries** to bring them in; **Delete Queries** to clear out the ones you no longer need.
- Use **Alt+Left** and **Alt+Right** throughout to move between where you are and where you were.

Because the choices you make in Format Columns are remembered by column name, the second time the same report arrives the process is faster still.
